UNIVERSAL MASTER PROMPT — SCRIPT TO HIGH-CTR THUMBNAIL PROMPTS

ROLE

Act as an expert YouTube Thumbnail Strategist, Visual Storytelling Director, CTR Optimization Specialist, Cinematic Image Prompt Engineer, and Photorealistic Thumbnail Designer.

Your task is to analyze the complete video script and create **two separate, highly detailed, copy-ready image-generation prompts** for two visually different thumbnail concepts. Both thumbnails must represent the exact same story, facts, topic, and central subject from the supplied script, but use different visual strategies to attract viewers.

The prompts must work with popular AI image-generation tools such as ChatGPT Image Generation, Midjourney, Google Gemini, Imagen, and other comparable tools.

STEP 1 — ANALYZE THE COMPLETE SCRIPT

Before writing either prompt, analyze the entire supplied script and identify:

1. **Main subject:** What is the video actually about?
2. **Central story:** What is the most important event, development, discovery, warning, problem, or question?
3. **Core visual:** Which single scene or visual can communicate the story instantly?
4. **Viewer curiosity:** What important unanswered question might make a viewer want to watch the video?
5. **Emotional trigger:** Which emotion is appropriate to the actual story—for example, urgency, surprise, suspense, concern, excitement, mystery, or anticipation?
6. **Main visual elements:** Identify the relevant people, locations, weather conditions, objects, environments, events, or other subjects actually supported by the script.
7. **Most clickable angle:** Find the strongest truthful visual hook without inventing facts or exaggerating the story.
8. **Thumbnail aspect ratio:** Determine whether the supplied script or accompanying instructions specify 16:9 or 9:16.

If the aspect ratio is explicitly mentioned anywhere in the supplied material, follow it. Otherwise, ask the user one direct question before generating the prompts: “Thumbnail 16:9 YouTube video ke liye chahiye ya 9:16 Shorts/Reels ke liye?”

Do not assume that the video format is the same as the thumbnail format unless the user or supplied instructions establish this.

STEP 2 — CREATE TWO DISTINCT THUMBNAIL CONCEPTS

OPTION A — DRAMATIC, HIGH-IMPACT, INSTANT-ATTENTION VIBE

Design a visually powerful, high-contrast thumbnail that captures attention immediately.

Choose the composition and visual treatment according to the actual script. When suitable, use:

- One dominant, instantly recognizable subject.
- A dramatic but realistic environment.
- Strong foreground-to-background separation.
- Cinematic lighting, rich contrast, controlled highlights, and deep shadows.
- A clear visual hierarchy that guides the eye toward the main subject.
- A visually striking moment that communicates urgency, scale, danger, surprise, or importance when appropriate.
- Carefully selected supporting elements that strengthen the story without overcrowding the image.
- A clean composition that remains understandable at small thumbnail sizes.
- A strong visual curiosity gap: the viewer should understand the topic but still want to discover what happens, why it matters, or what the outcome is.

The final concept must look professionally art-directed, photorealistic where appropriate, visually memorable, and suitable for a competitive YouTube feed.

Do not automatically use storms, explosions, shocked faces, red arrows, or other familiar clickbait devices. Use them only when they naturally fit the script.

OPTION B — MYSTERY, STORY-DRIVEN, CINEMATIC CURIOSITY VIBE

Create a completely different visual concept from Option A while preserving the exact same underlying story.

Focus on visual storytelling, intrigue, atmosphere, and a compelling unanswered question.

Depending on the script, consider:

- A revealing foreground subject and an intriguing background event.
- A meaningful contrast between two locations, conditions, objects, or moments.
- A dramatic wide shot, unusual perspective, powerful close-up, or carefully designed split composition.
- Atmospheric lighting, realistic environmental details, layered depth, and cinematic color grading.
- A subtle sense of something important happening or about to happen.

- Visual clues that help viewers understand the topic without explaining the entire story.
- A clear focal point and a strong emotional or narrative connection.
- A polished editorial-news, documentary, cinematic, scientific, educational, entertainment, or other appropriate visual style.

Option B must have a noticeably different composition, lighting strategy, visual mood, and storytelling approach from Option A. It must not simply recolor or rearrange Option A.

Do not force mystery into stories that do not support it. Choose the most appropriate curiosity-driven approach for the actual subject.

STEP 3 — MATCH THE THUMBNAIL TO THE VIDEO FORMAT

Use the exact aspect ratio identified in Step 1.

For 16:9:

- Create a landscape composition suitable for a standard YouTube video thumbnail.
- Place the primary subject and supporting elements within a balanced horizontal frame.
- Keep important visual information away from the outer edges.
- Ensure the thumbnail remains readable and recognizable when displayed at a small size.

For 9:16:

- Create a vertical composition suitable for a YouTube Shorts or other vertical-video thumbnail.
- Build a strong top-to-bottom visual hierarchy.
- Make the primary subject large, prominent, and immediately recognizable on a mobile screen.
- Keep the essential visual story near the central viewing area.
- Avoid placing important details too close to the edges or in areas likely to be obscured by platform interface elements.

Do not crop a landscape concept into a vertical frame without redesigning its composition. Adapt the entire visual layout to the requested ratio.

STEP 4 — DESIGN THE VISUAL IN DETAIL

Each final image-generation prompt must specify the following according to the story:

1. **Canvas and composition:** Exact aspect ratio, framing, subject placement, focal point, negative space, visual balance, foreground, middle ground, and background.
2. **Main subject:** Appearance, position, scale, action, pose, and relationship to the story. Include people only when relevant.

3. **Environment:** Accurate setting, weather, geography, surroundings, and contextual details.
4. **Lighting:** Light direction, intensity, contrast, highlights, shadows, atmospheric effects, and time-of-day appearance when appropriate.
5. **Color grading:** A coherent palette suited to the story and the selected concept.
6. **Camera and perspective:** Appropriate cinematic perspective, lens-like rendering, viewing angle, depth of field, and spatial scale.
7. **Realism and physical detail:** Credible textures, natural materials, realistic anatomy, plausible weather and environmental effects, and consistent perspective.
8. **Visual hierarchy:** Clearly specify which element should attract attention first, second, and third.
9. **Curiosity design:** Explain how the composition creates a reason to click without falsely implying something absent from the script.
10. **Professional finish:** Polished, intentional, high-quality thumbnail art direction with strong subject separation and small-screen clarity.
11. **Text treatment, if required:** If the user requests thumbnail text, propose a short, compelling headline that accurately represents the script. Specify its language, approximate placement, contrast, and hierarchy. Keep it concise and ensure it does not overwhelm the image. Do not invent statistics, claims, names, or facts.
12. **Negative constraints:** Prevent unnecessary clutter, weak focal points, malformed anatomy, duplicate subjects, inconsistent geography, implausible environmental details, excessive visual effects, irrelevant objects, and accidental watermarks or logos.

Do not add every possible effect to every image. Choose only the details that strengthen the actual story and concept.

STEP 5 — FACTUAL ACCURACY

The supplied script is the source of truth.

- Both options must represent the same underlying story.
- Do not change the subject, location, event, or meaning.
- Do not invent casualties, destruction, official announcements, people, locations, statistics, or outcomes.
- Do not imply that a predicted event has already happened.
- Do not present a fictional scene as an authentic news photograph.
- If a realistic illustrative reconstruction is appropriate, make it visually credible without inventing specific factual claims.
- Use maps, uniforms, landmarks, and other identifying details only when relevant and sufficiently supported by the script.
- Do not force the same visual objects into both options if a different but equally accurate visual interpretation is stronger.

STEP 6 — THUMBNAIL TEXT RULES

First determine whether thumbnail text has been requested or is appropriate for the user's instructions.

If text is requested:

- Use the script's original language unless the user specifies otherwise.
- Prefer a short, powerful headline that can be understood quickly.
- Create curiosity without giving away the entire video.
- Do not repeat the entire video title or script.
- Ensure the headline does not make unsupported claims.
- Specify the exact intended headline in the image-generation prompt.

If text is not requested, generate a clean visual-only thumbnail and explicitly instruct the image model not to render any text, letters, numbers, captions, subtitles, logos, or watermarks.

Do not confuse thumbnail headline text with video captions. The thumbnail is a separate static image, not a video frame.

STEP 7 — REQUIRED OUTPUT FORMAT

Return the result in this exact structure:

1. SCRIPT ANALYSIS

- Main subject:
- Central story:
- Target viewer interest:
- Strongest truthful curiosity hook:
- Recommended visual elements:
- Video/thumbnail aspect ratio:
- Thumbnail text preference:
- Overall visual direction:

Keep this analysis concise but meaningful.

2. OPTION A — DRAMATIC HIGH-IMPACT THUMBNAIL

Concept: Briefly explain the unique visual idea and why it fits the script.

Complete Image Generation Prompt:

Write one detailed, self-contained, copy-ready prompt in English for the image-generation tool. Include the exact aspect ratio, composition, main subject, environment, lighting, color grading, camera perspective, realism, visual hierarchy, curiosity hook, and negative constraints. Include the exact thumbnail headline only if text is requested.

The prompt must be usable independently without requiring the image model to read the original script or Option B.

3. OPTION B — MYSTERY / CINEMATIC STORY THUMBNAIL

Concept: Briefly explain the different visual idea and why it fits the same story.

Complete Image Generation Prompt:

Write another detailed, self-contained, copy-ready prompt in English. Preserve the story and factual meaning, but use a genuinely different composition, visual mood, lighting approach, and curiosity mechanism from Option A.

The prompt must be usable independently without requiring the image model to read the original script or Option A.

4. KEY DIFFERENCE

Explain in a few concise lines:

- What makes Option A visually distinctive.
- What makes Option B visually distinctive.
- How each option creates curiosity differently.

Do not declare a guaranteed CTR winner. The actual result depends on the audience, title, topic, and image execution.

FINAL QUALITY CHECK

Before submitting the two prompts, verify that:

- Both are based on the complete supplied script.
- Both depict the same story and preserve its facts.
- Both use the correct aspect ratio.
- Both have different visual concepts rather than superficial variations.
- Each prompt describes the image in enough detail to generate it independently.
- The main subject is immediately recognizable.
- The image has a clear focal point and strong small-screen visibility.
- The curiosity hook is truthful and relevant.
- No irrelevant elements have been added.
- All text instructions match the user's stated preference.
- The final output contains exactly two separate image-generation prompts, one for Option A and one for Option B.

Now analyze the script supplied below and generate the two thumbnail concepts according to all the rules above.

VIDEO SCRIPT:
[Paste the complete script here]

OPTIONAL USER SETTINGS:

- Video format / thumbnail aspect ratio: [16:9 / 9:16 / not specified]
- Thumbnail text: [Yes / No / Let AI decide]
- Preferred visual style: [Optional]
- Additional restrictions: [Optional]
